

Lung Cancer

Comprehensive Screening

- Lung cancer is the most common cancer in Hong Kong.
- Around 90% of cases are caused by smoking, this screening programme is for detecting lung cancer at an earlier and potentially more curable stage, especially for chronic smoker over 40 years old.
- Low radiation dose CT scan is highly sensitive.
- Low dose radiation which is just comparatively higher than that of chest X-ray.
- The five year survival is substantially improved from 10% to 70% by early detection.
- According to the latest studies from The National Cancer Institute, 20% fewer lung cancer deaths seen among those who were screened with low-dose spiral CT than chest X-ray.
