

Cataract surgery is a common minimally invasive eye procedure that uses ultrasound to break up the cataract and suction it out. A foldable soft intraocular lens can then be implanted through a small incision of only 2.2 to 2.8 millimeters. The surgery does not require stitches, only local anesthesia, and can be completed in about 30 minutes. The advantages of this surgery include fewer complications, rapid recovery of vision, and new intraocular lenses that can improve presbyopia and astigmatism.

Package Includes:

Surgeon's operation fee and local anesthesia fee
Pre-operative measurement of the intraocular lens power
Day surgery room equipment and materials
Implantation of a transparent monofocal intraocular lens
One follow-up consultation after surgery (to be completed within two weeks post-surgery)
Post-operative medications

Package Price (HKD):

(1) Cataract removal and intraocular lens implantation
(single eye / day surgery) Package Price: HK\$20,100

Remarks:

- The above price is only applicable to non-inpatient clients.
