

Cataract surgery is a common minimally invasive eye procedure that uses ultrasound to break up the cataract and suction it out. A foldable soft artificial lens can then be implanted through a small incision of only 2.2 to 2.8 millimeters. The surgery does not require stitches, only local anesthesia, and can be completed in about 30 minutes. The advantages of this surgery include fewer complications, rapid recovery of vision, and new artificial lenses that can improve presbyopia and astigmatism.

Package Includes:

Specialist surgeon's fee and local anesthesia fee
Preoperative measurement of the artificial lens power
Day surgery room equipment and materials
Implantation of a clear monofocal artificial lens, commonly known as "white mirror"
One follow-up visit after surgery (to be completed within two weeks post-surgery)
Necessary postoperative medications

Package Price (HKD):

(1) Cataract removal and artificial lens implantation (single eye / day surgery):
\$20,100
